Office Action Summary		10/567,326	SEKINO ET AL.			
		Examiner	Art Unit			
		Edu E. Enin-Okut	1795			
The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply						
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Detailed Action

1. The amendments filed on December 10, 2009 were received. Applicant has amended claims 1, 3,

and 6. Claims 1 and 3, 4, and 6-12 are pending.

2. The text of those sections of Title 35, U.S. Code not included in this action can be found in a

prior Office action.

Claim Rejections - 35 USC § 103

3. The rejection of claims 1, 3, 4 and 6-12 under 35 U.S.C. 103(a) as being unpatentable over Hirsch

et al. (US 2004/0209133) is maintained. The rejection is repeated below for convenience.

Regarding claims 1, 3, 4, 8, 9 and 11, Hirsch teaches a fuel cell system 100 including a fuel cell

102 that has a membrane electrode assembly (MEA) composed of a proton-conductive electrolyte 103

[solid electrolyte membrane] disposed between a catalyzed anode aspect 104a [fuel electrode] and a

catalyzed cathode aspect 104b [oxidant electrode] (para. 47; Fig. 1). Liquid fuel is contained in a fuel

tank 110 (para. 48). A fuel delivery regulation assembly 120 is disposed between the fuel tank 110 and a

passive mass transport barrier element 112 (i.e., a methanol delivery film, MDF), or between the MDF

212 and a vapor chamber 216 [fuel vessel] holding vaporous fuel fed to the anode (para. 49, 51, 52; Figs.

1, 2). The regulation assembly 120 can be used to limit or control the amount of fuel that travels from the

tank 110 to the MDF 112, or the fuel delivery directly to the anode aspect (para. 51, 52).

Hirsch also teaches several fuel delivery regulation assembly embodiments. An embodiment of

the assembly includes a slidable shutter assembly 400 [shutter member] with the size of its apertures

controlled by the relative placement of first and second components 402a, 402b (para. 53-59; Figs. 3A-

4B). The shutter assembly is actuated by a control system 408 which may include mechanical means,

Art Unit: 1795

such as servos and/or a motor with a gear and lever assembly [rotary unit] (para. 58, 59; Figs. 4A, 4B). Another aspect of the fuel delivery regulation assembly includes a fuel flow control element 1205 [permeation control film] that is an expandable material actuated by a variety of mechanisms, such as methanol concentration, in order to regulate the flow of fuel to the MEA (para. 78, 79; Figs. 12A, 12B).

Although Hirsch does not expressly teach that the fuel supplier includes *both* a permeation control film and shutter member (emphasis added), it has been held that "[i]t is *prima facie* obvious to combine two compositions each of which is taught by the prior art to be useful for the same purpose, in order to form a third composition to be used for the very same purpose.... [T]he idea of combining them flows logically from their having been individually taught in the prior art." *In re Kerkhoven*, 626 F.2d 846, 850, 205 USPQ 1069, 1072 (CCPA 1980). See MPEP 2144.06 (I).

Regarding claim 6, Hirsch teaches that actuation of the slidable shutter assembly is controlled by a control system, as described above. The reference also teaches that the control system may respond to feedback from the fuel cell system, such as that generated based on the concentration of fuel that is being delivered to the anode aspect of the MEA (para. 66).

Regarding claim 7, Hirsch teaches a fuel flow control assembly may include a series of expandable components 1121a-c, which expand upon actuation (in response to methanol concentration changes, for example), and a series of second components 1215a-d (para. 79; Fig. 12B). When expandable components 1121a-c are not actuated, the second components 1215a-d are fully open and permit the flow of fuel through it (para. 80). When the expandable components are actuated, they expand which causes the second components to deform and thus restrict the fuel flow (para. 79). The entire assembly may be used as the fuel control element 1205 shown in Fig. 12A (para. 79). It would have been obvious to one of ordinary skill in the art at the time of the invention to form the deformable, second components described above as holes, or cut portions, formed in the expandable material of the fuel

control element of Hirsch because holes formed in the expandable material would perform in a manner similar to that described.

Regarding claim 10, Hirsch teaches a fuel flow control assembly 1220 may include a housing 1222 with openings (to allow fuel to flow therethrough) and one or more flexible bladders 1224 (para. 80; Fig. 12C). By expanding the bladder via filling it with anodically generated carbon dioxide, the housing expands to control introduction of fuel (from the fuel tank [fuel supply unit]), to the MEA (para. 80).

Although Hirsch does not expressly teach that the fuel supply unit itself is configured so as to change its volume depending on its internal pressure (emphasis added), since it has been held that forming in one piece an article which has formerly been formed in several pieces and put together involves only routine skill in the art (e.g., In re Larson, 340 F.2d 965, 968, 144 USPQ 347, 349 (CCPA 1965)), it would have been obvious to one having ordinary skill in the art at the time the invention was made to configure the fuel supply unit used in the fuel cell system of Hirsch to change its volume in response to its internal pressure because Hirsch teaches that this is another means with which to control fuel flow. See MPEP 2144.04 (V)(B).

Regarding claim 12, Hirsch teaches that the bladder 1224 of a fuel flow control assembly 1220 is filled it with anodically generated carbon dioxide [gas produced at the fuel electrode], as discussed above with respect to claim 10.

Although Hirsch does not expressly teach that a gas duct guides the carbon dioxide discussed above, it would have been obvious to one of ordinary skill in the art at the time of the invention to use piping, such as a gas duct, to move the gas produced at the fuel electrode used in the fuel cell system of Hirsch to its fuel vessel because ducts are well-known in the art as means with which to

Response to Arguments

4. Applicant's arguments filed December 10, 2009 have been fully considered but they are not persuasive. In sum, applicants make the following arguments in their remarks:

- (a) "... Hirsch teaches a vapor fuel supply system, while Applicants claim a fuel supplier in a liquid fuel supply system." (see p. 5);
- (b) "... Hirsch also fails to teach a "permeation control film that comprises a liquid fuel permeable film" as required by Applicants' independent claim 1 ... Instead, ... Hirsch merely teaches an MDF, which converts a liquid fuel to a vapor fuel. Hirsch's MDF cannot be said to be a liquid fuel permeable film because liquid fuel cannot permeate the MDF." (see p. 5);
- (c) "...Hirsch fails to teach "said permeation control film restricts the amount of transmission of said supplementary liquid fuel <u>based on a fuel concentration of a liquid fuel in said fuel supply system</u>" as required by claim 1. ..." (see p. 6); and,
- (d) "... in accordance with the instant claimed invention, the concentration of the liquid fuel in the fuel vessel is adjusted to power generation, and the permeation control film and the shutter member control the movement of the constituent of the fuel, and the supplementary liquid is more concentrated than the liquid fuel in the fuel vessel." (see p. 6)
- As to applicants' arguments (a)-(c) above, it appears that applicant fails to appreciate that the Hirsch reference teaches "... The regulation assembly 120 can be used to limit or control the amount of fuel that travels from the tank 110 to the MDF 112, or the fuel delivery directly to the anode aspect [emphasis added] (para. 51, 52). ... Another aspect of the fuel delivery regulation assembly includes a fuel flow control element 1205 [permeation control film] that is an expandable material actuated by a variety of mechanisms, such as methanol concentration, in order to regulate the flow of fuel to the MEA (para. 78, 79; Figs. 12A, 12B). ...", as described in the rejections presented above. Thus, applicants' contentions with respect to the Hirsch reference are not persuasive.
- 6. As to applicants' argument (d) above, it is noted that the features upon which applicant relies are not recited in the rejected claims. Although the claims are interpreted in light of the specification,

limitations from the specification are not read into the claims. See In re Van Geuns, 988 F.2d 1181, 26

Page 6

USPQ2d 1057 (Fed. Cir. 1993).

Conclusion

7. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set

forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from

the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing

date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH

shortened statutory period, then the shortened statutory period will expire on the date the advisory action

is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

the advisory action. In no event, however, will the statutory period for reply expire later than SIX

MONTHS from the mailing date of this final action.

Contact Information

Any inquiry concerning this communication or earlier communications from the examiner should

be directed to Edu E. Enin-Okut whose telephone number is 571-270-3075. The examiner can normally

be reached on Monday to Thursday, 7 a.m. - 3 p.m. (EST).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Dah-

Wei Yuan can be reached on 571-272-1295. The fax phone number for the organization where this

application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application

Information Retrieval (PAIR) system. Status information for published applications may be obtained

from either Private PAIR or Public PAIR. Status information for unpublished applications is available
